AutoCAD Architecture Autocad Architecture is a professional standard-based BIM (Building Information Modelling) software,

purpose-built for designing and documenting buildings and their construction. It provides a powerful, fully integrated approach to design and documentation, with an emphasis on BIM. It is the building information modelling (BIM) system for multi-disciplinary design teams and projects. AutoCAD Architecture is a powerful design tool that helps architects, engineers, builders and contractors design and produce a variety of design, documentation and construction documents and other related work products. AutoCAD Architecture was introduced in Autodesk's AutoCAD 2009 software and is also available as a client-server product. While Autocad Architecture is focused on design, it also integrates into the AutoCAD Project Manager. AutoCAD Architecture is designed for the creation of BIM models. BIM (building information modelling) is a method of design, documentation, construction and operation of the built environment. It is designed to allow all aspects of the built environment to be captured in one model, including geometry, structural analysis, property information and financial information. AutoCAD Architecture features multi-disciplinary design and collaboration. Multi-disciplinary design refers to the design of buildings and structures by specialists in different disciplines. It allows these disciplines to work closely together during the design process. These disciplines include architects, engineers, contractors and others. AutoCAD Architecture was the first professional standard-based BIM software. It allows individuals or organizations to generate 2D and 3D design documents, including structural and non-structural data. It supports all aspects of the built environment, including design, documentation, construction and operation. In AutoCAD Architecture, users can collaborate across different disciplines throughout the design and documentation processes. Design-to-order processes, including engineering, manufacturing and construction, can be more streamlined. AutoCAD Architecture allows users to view designs and document building information within a web browser. They can save their work to other formats (notably PDF) and later recover the work if necessary. This allows on-site designers to work more efficiently. AutoCAD Architecture also allows users to work with fellow designers and other disciplines, such as engineers and architects, across multiple devices, on site or from off-site. This helps to ensure that the team can work efficiently throughout the design process. AutoCAD Architecture was named "BIM software" of the year by CAD User magazine in 2013. 5b5f913d15

Chapter 2: Working with Drawing Commands Working with Commands Understanding the Environment Many drawing commands that you create are related to one another. For example, a linetype is a shape that is filled with a line and then a linetype can be a fill for another shape. Creating a Drawing Creating a Drawing Applying a Temporary Command How to work with a Temporary Command Managing Workspaces Creating a Workspace Applying a Group How to work with a Group Working with Drawing Commands Temporary Commands and Drawing Templates Using Temporary Commands Using Drawing Templates Understanding the Environment In AutoCAD, you can access many commands through a user interface called the Ribbon. The Ribbon contains various tabs, and each tab contains groups and commands. The Ribbon groups are collections of commands, and each group contains a set of commands that perform a similar task. If you are just beginning with AutoCAD, you might not be aware of all the different functions of the Ribbon. In this chapter, you will learn about the different tabs and how they can help you access commands. Understanding the Environment The Ribbon gives you access to tools for
