The night went well and she was finally able to see her boyfriend. The only problem was that her boyfriend's laptop had a virus and so the only way she could see him was through his laptop, through his laptop, and so on, without connecting back to her laptop. In how many ways could she have connected to her boyfriend if he wasn't infected with the virus? I tried to solve it like that: The mathematician started with her laptop. Since the initial vertex, there are 4 possible ways to move to her laptop. Once

we arrived there we can move to her boyfriend's laptop. Since the initial vertex, there are also 4 possible ways to move to his laptop, but only 1 of them can be left. So there are: $\frac{4!}{1!}$ possibilities move to her laptop, move to his laptop, move to his laptop, move to her laptop, $\frac{$ ca3bfb1094
