"People don't understand that my position is not that simple," Donald Trump said. | AP Photo Trump clarifies he's not 'happy' about Comey's firing Donald Trump on Thursday insisted he's not "happy" about the firing of former FBI Director James Comey, but that he is "a little unhappy" with it nonetheless. "I'm not happy at what I'm reading," the Republican nominee told reporters on Air Force One when asked about the decision. "I'm just saying that you people in the media, you are a sick group." When pressed further, Trump said he was "a little unhappy, to be honest with you" about the move. "I am not happy at all with what is being done," he added. "So I just want everybody to understand, I'm not happy, I'm not happy at what's going on, but at the same time, I'm not going to go out and be totally negative and say the sky is falling," he said. "I would like to take a look and see what he's been doing." The President's eldest son, Donald Trump Jr., tweeted that "everybody is happy" about the Comey firing. The CEO of Lockheed Martin, Marillyn Hewson, applauded Trump's decision in a series of tweets. "I'm glad to see Director Comey go. Looked like a total disgrace. Acted very, very badly. Totally conflicted. Completely biased and wrong." She added: "The American people deserves [sic] better and so do we. Pray for FBI!" Amanda Berry is seen through ca3bf1094

Effect of carbon monoxide on cerebrospinal fluid oxygenation and cerebral blood flow during chronic hypoxemia in rats. The effect of chronic hypoxemia on CSF O<sub>2</sub> and CBF was investigated in chronically cannulated, normocapnic rats. Mean arterial blood pressure and CSF pressure were maintained constant with an infusion of lactated Ringer solution, while the partial pressures of O<sub>2</sub> and CO<sub>2</sub> in the blood and the CSF were modulated. The CSF O<sub>2</sub> was 21 +/- 1 mm Hg (mean +/- S.E.) when the partial pressure of O<sub>2</sub> in the blood was kept constant at 0.37 +/- 0.1 mm Hg; when the O<sub>2</sub> was decreased stepwise to 0.09 +/- 0.01 mm Hg, a linear decrease of the CSF O<sub>2</sub> with a concomitant linear increase in CBF was seen. CBF and O<sub>2</sub> were inversely related throughout the experiments (r = -0.96). There was no linear relationship between the decrease in CBF and the decrease in O<sub>2</sub> in the CSF. When the partial pressure of CO<sub>2</sub> in the blood was increased from 2.9 +/- 0.4 to 6.4 +/- 0.5 mm Hg by addition of 0.5 percent CO, the CSF O<sub>2</sub> decreased from 21 +/- 1 to 18 +/- 1 mm Hg (P less than 0.05). The decrease in CSF O<sub>2</sub> was linearly related to the increase in CBF (r = -0.96). These data
